

TAKE OUR AIA ACCREDITED COURSE

PROTECT YOUR WORK

COURSE DESCRIPTION

Surface protection is insurance against damage to a project's installed materials, saving time and money by keeping jobsite clean up and repair to a minimum.

Proper surface protection protects the bottom line and keeps the profit in the project. It helps ensure the finished project meets or exceeds the architect's and client's vision and keeps the jobsite safer for workers. The architect can and should specify the correct protection products.

This course examines the damages known to occur on jobsites and the considerations in choosing a temporary surface protection product.

We will discuss the latest surface protection technology for specific surfaces during all stages of construction, their importance on the jobsite, and how the jobsite circumstances need to be considered when selecting temporary surface protection products.
